PERICOM®

## 3.3V, 20-Bit *NanoSwitch*™ w/Precharged Outputs

Product Features

- Near Zero Propagation Delay
- 5-ohm Switches Connect Between Two Ports
- Fast Switching Speed: 4.5ns max.
- B-Port Outputs are precharged by Bias Voltage to minimize signal distortion during live insertion
- Package options include:
  – 48-pin 150-mil wide plastic BQSOP (B)
  – 48-pin 240-mil wide plastic TSSOP (A)
  – 48-pin 300-mil wide plastic SSOP (V)

Product Description

Pericom Semiconductor's PI3B series of logic circuits are produced using the company's advanced submicron CMOS Technology.

The PI3B16215 provides 20-bits of high-speed bus switching. The switches low ON-state resistance allows connections to be made with minimal propagation delay also precharges the B-port to a user-selectable bias voltage (BIASV) to minimize live-insertion noise.

The device is organized as dual 10-bit bus switches with individual output-enable ($\overline{OE}$) inputs. When $\overline{OE}$ is LOW, the corresponding 10-bit bus switch is on and port A is connected to port B. When $\overline{OE}$ is HIGH, the switch is open, a high-impedance state exists between the two ports, and port B is precharged to BIASV through the equivalent of a 10-kohm resistor.

To ensure the high-impedance state on power up or power down, $\overline{OE}$ should be tied to V_{CC} through a pullup resistor; the minimum value of the resistor is determined by the current-sinking capability of the driver connected to $\overline{OE}$.

Logic Block Diagram
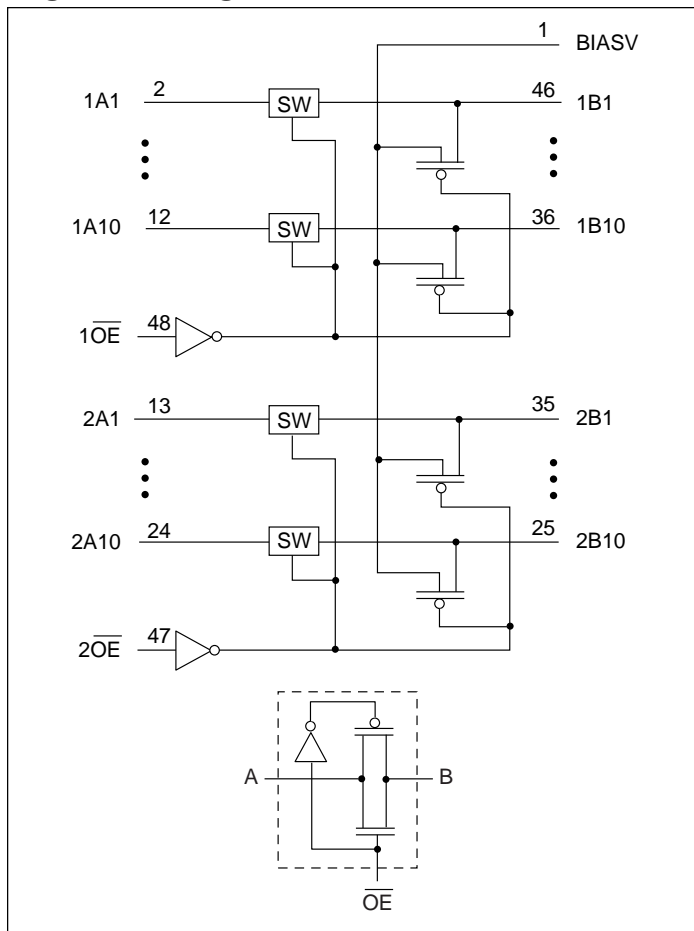

Product Pin Configuration
Maximum Ratings

(Above which useful life may be impaired. For user guidelines, not tested.)

Storage Temperature Range, T_{STG}	–65ºC to +150ºC
Supply Voltage Range, V_{CC}	–0.5V to +4.6V
Bias Voltage Range, BIASV	–0.5V to +4.6V
Input Voltage Range	–0.5V to +4.6V
DC Output Current	120mA
Power Dissipation	0.5W

Note:

Stresses greater than those listed under MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

Electrical Characteristics (Over the Operating Range, T_A = –40°C to +85°C, V_{CC} = 3.0V to 3.6V)

Parameter	Description	Test Conditions		Min.	Typ.	Max.	Units
BIASV	Bias Voltage			0		V_{CC}	
V_{IH}	High-Level Control Input Voltage	V_{CC} = 2.7V to 3.6V		2			V
V_{IL}	Low-Level Control Input Voltage	V_{CC} = 2.7V to 3.6V		–0.5		0.8	
V_{IK}	Clamp Diode Voltage	V_{CC} = 3.0V	I_I = –18mA		–0.7	–1.2	
I_I	Input Current	V_{CC} = 3.6V	V_I = V_{CC} or GND			±5	μA
I_{OZH}	High Impedance Output Current	V_{CC} = 0	V_I = V_O = 0 to 3.6V			10	
I_O	Output Current	V_{CC} = 3.0V	BIASV = 2.4V, V_O = 0	0.15			mA
I_{CC}	Quiescent Power Supply Current	V_{CC} = 3.6V	I_O = 0, V_I = V_{CC} or GND			10	
ΔI_{CC}[1]	Supply Current	V_{CC} = 3.6V	One Input at 3V, Other Inputs at V_{CC} or GND			750	μA
C_{IN}	Input Capacitance	V_I = 3.0V or 0			3.0		pF
C_{OFF}	A/B Capacitance Switch Off	V_O = 3.0V or 0	Switch Off		8.5		
R_{ON}[2]	Switch On Resistance	V_I = 0	I_I = 64mA		5	8	Ω
			I_I = 24mA		5	8	
		V_I = 2.4V	I_I = 15mA		10	15	

Notes:

1. This is the increase in supply current for each input ($\overline{OE}$ only) that is at the specified voltage level rather than V_{CC} or GND.
2. Measured by the voltage drop between the A and B terminals at the indicated current through the switch. On state resistance is determined by the lower of the voltages of the two (A or B) terminals.

Truth Table

$\overline{OE}$	Function
L	A port = B port
H	A port = Z, B Port = BIASV

Switching Characteristics over Operating Range
(Switching characteristics over recommended operating free-air temperature range unless otherwise noted)

Parameter	Test Conditions	From (Input)	To (Output)	V_{CC} = 3.3V ±10%		Units
				Min.	Max.	
$t_{PD}^{(1)}$		A or B	B or A		0.25	ns
t_{PZH}	BIASV = GND	$\overline{OE}$	A or B		4.5	
t_{PZL}	BIASV = 3V				4.5	
t_{PHZ}	BIASV = GND				5.0	
t_{PLZ}	BIASV = 3V				5.0	

Note:
1. The propagation delay is the calculated RC time of the typical on-state resistance of the switch and the specified load capacitance, when driven by an ideal voltage source (zero output impedance).

## Parameter Measurements (V_{CC} = 2.7 and 3.3V ±10%)

Test	S1
t_{PD}	Open
t_{PLZ}/t_{PZL}	6V
t_{PHZ}/t_{PZH}	GND

**Figure 1. Load Circuit and Voltage Waveforms**

Notes:
1. C_L includes probe and jig capacitance.
2. Waveform 1 is for an output with internal conditions such that the output is low except when disabled by the output control. Waveform 2 is for an output with internal conditions such that the output is high except when disabled by the output control.
3. All input impulses are supplied by generators having the following characteristics: PRR ≤ MHz, Z_O = 50Ω, t_R ≤ 2.5ns, t_F ≤ 2.5ns.
4. The outputs are measured one at a time with one transition per measurement.
5. t_{TPZ} and t_{PHZ} are the same as t_{DIS}
6. t_{PZL} and t_{PZH} are the same as t_{EN}
7. t_{PLH} and t_{PHL} are the same as t_{PD}

Applications Information

Logic Inputs

The logic control inputs can be driven up to +3.6V regardless of the supply voltage. For example, given a +3.3V supply, IN may be driven low to 0V and high to 3.6V. Driving IN Rail-to-Rail® minimizes power consumption.

Power-Supply Sequencing and Hot Plug Information

Proper power-supply sequencing is recommended for all CMOS devices. Always apply V_{CC} before applying V_{BIAS} and signals to input/output or control pins.

Rail-to-Rail is a registered trademark of Nippon Motorola, Ltd
