# REVISION

| Date              | Rev | Comments  |
|-------------------|-----|---|
| November 21, 2008 | A   | Initial Release   |
| December 02, 2008 | B   | Updated DEMO9S08LG32 connector pins, features, MCU I/O port, and demonstration board diagram. |
| February 24, 2009 | C   | Minor updates to format and corrections to content. Added Notes and Caution boxes             |

## CAUTIONARY NOTES

- 1) Electrostatic Discharge (ESD) prevention measures should be used when handling this product. ESD damage is not a warranty repair item.
- 2) Axiom Manufacturing does not assume any liability arising out of the application or use of any product or circuit described herein; neither does it convey any license under patent rights or the rights of others.
- 3) EMC Information on the DEMO9S08LG32 board:
  - a) This product as shipped from the factory with associated power supplies and cables, has been verified to meet with requirements of CE and the FCC as a CLASS A product.
  - b) This product is designed and intended for use as a development platform for hardware or software in an educational or professional laboratory.
  - c) In a domestic environment, this product may cause radio interference in which case the user may be required to take adequate prevention measures.
  - d) Attaching additional wiring to this product or modifying the products operation from the factory default as shipped may effect its performance and cause interference with nearby electronic equipment. If such interference is detected, suitable mitigating measures should be taken.

## TERMINOLOGY

This development module utilizes option select jumpers to configure default board operation. Terminology for application of the option jumpers is as follows:

**Jumper** – a plastic shunt that connects 2 terminals electrically

**Jumper on, in, or installed** = jumper is a plastic shunt that fits across 2 pins and the shunt is installed so that the 2 pins are connected with the shunt.

**Jumper off, out, or idle** = jumper or shunt is installed so that only 1 pin holds the shunt, no 2 pins are connected, or jumper is removed. It is recommended that the jumpers be placed idle by installing on 1 pin so they will not be lost.

**Cut-Trace** – a circuit trace connection between component pads. The circuit trace may be cut using a knife to break the default connection. To reconnect the circuit, simply install a suitably sized 0-ohm resistor or attach a wire across the pads.

Signal names followed by an asterisk (\*) denote active-low signals.

# FEATURES

The DEMO9S08LG32 is a demonstration board for the MC9S08LG32 microcontroller. Application development is quick and easy with the integrated USB-BDM, sample software tools, and examples. An optional BDM\_PORT port is also provided to allow use of a BDM\_PORT cable. One, 80-pin connector provides access to all IO signals on the target MCU.

- MC9S08LG32, 80 LQFP
  - 32K Bytes Flash
  - 2K Bytes RAM
  - Internal Oscillator
- On-Board 4x40 Custom LCD Glass
- Integrated P&E USB-BDM
- BDM\_PORT header for BDM cable support
- MCU\_PORT pin header for access to MCU IO signals
- On-board +5V regulator
- Optional Power from USB-BDM or MCU\_PORT connector
- Power Input Selection Jumpers
  - Power input from USB-BDM
  - Power input from on-board regulator
  - Power input from Connector J1
  - Optional Power output through Connector J1
- User Components Provided
  - 10 Push Switches; 8 User, 1 Reset, 1 IRQ
  - 12 LED Indicators; 8 User, VDD, IRQ, USB, and reset
  - 5K ohm POT w /LP Filter for ADC input
  - LCD Glass Contrast POT
  - 2.3kHz Piezo Buzzer
- User Option Jumpers to disconnect Peripherals
- User Option Jumpers to disconnect LCD Signals
- Connectors
  - 80-pin MCU I/O Pin Header
  - 2.0mm Barrel Connector
  - BDM\_PORT Connector for External BDM Cable
  - USB Connector
  - DB9 Connector (not installed)

## Specifications:

Board Size 5.5" x 4.5"

### NOTE:

Manual LCD contrast control requires +12V power input at VIN barrel connector.

## MEMORY MAP

The table below shows the default memory map for the MC9S08LG32 immediately out of reset. Refer to the MC9S08LG32 Data Sheet (DS) for further information.

**Figure 1: Memory Map**

|                 |                       |
|-----------------|-----------------------|
| \$0000 - \$005F | Direct Page Registers |
| \$0060 - \$081F | RAM<br>1980 Bytes     |
| \$0820 - \$085C | LCD Registers         |
| \$0860 - \$17FF | Unimplemented         |
| \$1800 - \$187A | High Page Registers   |
| \$187B - \$7FFF | Unimplemented         |
| \$8000 - \$BFFF | FLASH A               |
| \$C000 - \$FFFF | FLASH B               |

## SOFTWARE DEVELOPMENT

Software development requires the use of a compiler or an assembler supporting the HCS08 instruction set and a host PC operating a debug interface. CodeWarrior Development Studio for Microcontrollers is supplied with this board for application development and debug. Refer to the supporting CodeWarrior documentation for details on use and capabilities.

# DEVELOPMENT SUPPORT

Application development and debug for the target MC9S08LG32 is supported through the background debug mode (BDM) interface. The BDM interface consists of an integrated USB-Multilink BDM and a 6-pin interface header (BDM\_PORT). The BDM\_PORT header allows connecting a HCS12/HCS08 BDM cable.

## Integrated BDM

The DEMO9S08LG32 board features an integrated USB-Multilink BDM from P&E Microcomputer Systems. The integrated USB-Multilink BDM supports application development and debugging via background debug mode. All necessary signals are provided by the integrated USB-Multilink BDM. A USB, type B, connector provides connection from the target board to the host PC.

The integrated USB-Multilink BDM provides power and ground to the target board eliminating the need to power the board externally. Power from the USB-Multilink BDM is derived from the USB bus; therefore, total current consumption for the target board, and connected circuitry, **must not exceed 500mA**. This current limit describes the current supplied by the USB cable to the BDM circuit, the target board, and any connected circuitry. Excessive current drain will violate the USB specification causing the bus to disconnect. Damage to the host PC USB hub or the target board may result.

### *USB-BDM OPTION Headers*

Option header JP2 connects two timer channels to the USB-BDM to facilitate the Signal Analyzer functionality. Installing an option jumper shunt enables the selected timer channel to the BDM circuitry.

**Figure 2: JP1 Option Header**

## BDM\_PORT Header

A compatible HCS12 BDM cable may also attach to the 6-pin BDM interface header (BDM\_PORT). Figure 3 below shows the pin-out for the BDM\_PORT header.

**Figure 3: BDM\_PORT Header**

|      |   |   |     |        |
|------|---|---|-----|--------|
| BKGD | 1 | 2 | GND |        |
|      | 3 | 4 |     | RESET* |
|      | 5 | 6 |     | VDD    |

Refer to MC9S08LG32 Reference Manual for complete details

## POWER

The DEMO9S08LG32 uses several methods to apply power to the board. An option header allows selection between the various power inputs. For application development and debug, the board may be powered from the USB BDM. The 2.0mm, center-positive, barrel connector (VIN) supports stand-alone operation and higher power requirements. Power may also be applied to connector J1 or the board may be configured to supply power from connector J1 to external circuitry.

### CAUTION:

Damage to the board may result if voltages greater than +5.5V are applied at the connector J1 input.

## POWER SELECT

Power may be applied to the board through the integrated USB-Multilink BDM circuitry, a 2.0mm barrel connector, or through connector J1. Power selection is achieved using 2 selection headers: the PWE\_SEL option header and the VX\_EN option header.

### *PWR\_SEL*

The PWR\_SEL option header allows the user to select power input either from either an external power source connected to the VIN connector or from the integrated USB-BDM. Figure 4 below details the PWR\_SEL header connections.

**Figure 4: V\_SEL Option Header**

|         |     |    |  |
|---------|-----|----|--|
|         | VR1 | VB |  |
| PWR_SEL |     |    | Enable power to board from external power supply |
| PWR_SEL |     |    | Enable power to board from Integrated USB-BDM    |

**CAUTION:**

Total power from the USB-BDM is limited to **500 mA**. Exceeding this limit violates the USB specification and will cause the USB bus to disconnect. Damage to the target board and the host PC may result.

Power from the integrated BDM is drawn from the USB bus and is limited to **500 mA**. This current limit accounts for the total current supplied over the USB cable to the BDM circuit, the target board, and any connected circuitry. Current drain in excess of 500 mA will violate the USB specification and will cause the USB bus to disconnect. This will cause the board to exhibit power cycling where the board appears to turn-on then off continually. Damage to the host PC or the target board may also result.

Power input to the VIN barrel connector should not exceed +12V. LCD contrast is connected directly to the VIN power input.

**CAUTION:**

Voltage input exceeding +12V applied to VIN may damage the target board

*VX\_EN*

The VX\_EN option header is a 2-pin jumper that connects or disconnects input J1-1 directly to the target board voltage rail. J1-3 connects directly to the target board ground plane. Use of this feature requires a regulated input power source. This power input is decoupled to minimize noise but is not regulated or protected. Care should be exercised when using this feature; no protection is applied on this input and damage to the target board may result if excessive voltage is applied. Also, do not attempt to power the target board through this connector while also applying power through the USB-Multilink BDM or the PWR connector; damage to the board may result.

Power may also be sourced to off-board circuitry through the J1 connector. The current supplied from the USB bus or the on-board regulator limits current available to external circuitry. Excessive current drain may damage the target board, the host PC USB hub, or the on-board regulator. The figure below details the VX\_EN header connections.

**Figure 5: VX\_EN Option Header**

**CAUTION:**

Do not exceed available current from USB-BDM or on-board regulator when sourcing power through connector J1 to external circuitry.

## RESET SWITCH

The RESET switch applies an asynchronous RESET to the MCU. The RESET switch is connected directly to the RESET\* input on the MCU. Pressing the RESET switch applies a low voltage level to the RESET\* input. A pull-up bias resistor allows normal MCU operation. Shunt capacitance ensures an adequate input pulse width.

## LOW VOLTAGE RESET

The MC9S08LG32 utilizes an internal Low Voltage Detect (LVD) circuit. The LVD holds the MCU in reset until applied voltage reaches an appropriate level. The LVD also protect against under-voltage conditions. Consult the MC9S08LG32 reference manual for details LVD operation.

## TIMING

The DEMO9S08LG32 internal timing source is active from RESET by default. An external 32 kHz XTAL oscillator, configured for low-power operation, is also provided. Refer to the MC9S08LG32 Reference Manual for details on configuring the selected timing source.

## COMMUNICATIONS

The DEMO9S08LG32 supports serial communications through the integrated USB-BDM and an on-board, low-voltage, RS-232 transceiver. The COM\_SEL header selects the serial path applied. The 9-pin, D-Sub, connector at COM1 is not installed in default configurations.

## USB SERIAL LINK

The integrated USB-BDM provides a serial link from the target MCU to the host PC through the host application. Refer to the P&E Multilink documentation for further details.

## RS-232

An RS-232 translator provides RS-232 to TTL/CMOS logic level translation on the COM connector. The COM connector is a 9-pin Dsub, right-angle connector. A ferrite bead on shield ground provides conducted immunity protection. Communication signals TXD1 and RXD1 are routed from the transceiver to the MCU. Hardware flow control signals RTS and CTS are available on the logic side of the transceiver. These signals are routed to vias located near the transceiver. RTS has been biased properly to support 2-wire RS-232 communications.

**Figure 6: COM Connections**

| MCU Port        | COM Signal | I/O PORT CONNECTOR |
|-----------------|------------|--------------------|
| PTI1/TMRCLK/TX2 | TXD        | J1-5               |
| PTI0/RX2        | RXD        | J1-7               |

### COM Connector

A standard 9-pin Dsub connector provides external connections for the SCI0 port. The Dsub shell is connected to board ground through a ferrite bead. The ferrite bead provides noise isolation on the RS-232 connection. The figure below details the DB9 connector.

**Figure 7: COM1 Connector**

Female DB9 connector that interfaces to the MCU internal SCI0 serial port via the RS232 transceiver. Flow control is provided at test points on the board.

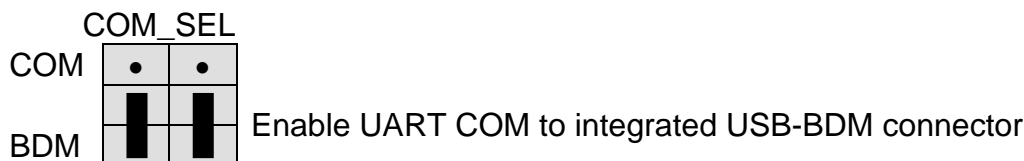

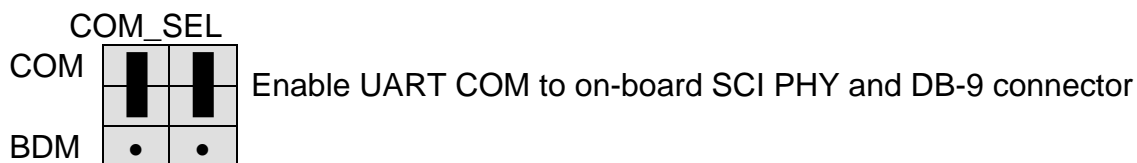

**Pins 1, 4, and 6 are connected together.**

**NOTE:** The COM1 connector is not installed in default configurations.

### COM\_SEL

The COM\_SEL option header connects the MCU SCI port to either the SCI PHY or the USB-BDM connection. Figure 8 below shows the option jumper configuration for the COM\_SEL option header.

**Figure 8: COM\_SEL Option**

**NOTE:** The silkscreen marking for the COM\_SEL header is incorrect on Rev A boards. The RXD position enables COM through the DB9 connector while the TXD position enables COM through the integrated USB-BDM.

## LCD

The DEMO9S08LG32 provides a 4 x 40 custom LCD glass connected directly to the target MCU. Refer to the MC9S08LG32 Reference Manual for details on use and configuration.

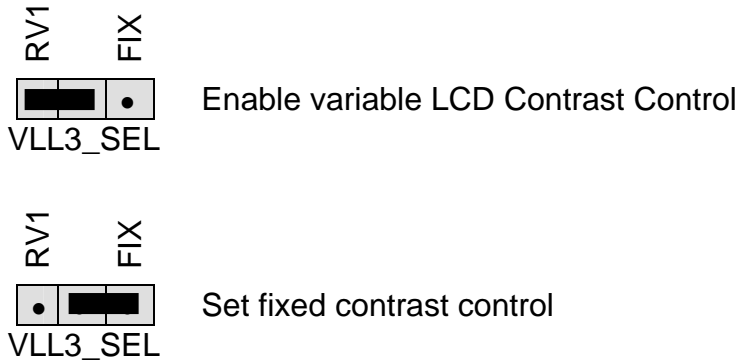

A row of option jumpers located below the LCD module allows each LCD signal to be disconnected from the associated LCD input. This allows multiplexed signal functionality to be used without affecting the LCD module.

The LCD Enable Option Header allows the user to disable any LCD signal to the LCD. This allows any signal to be used for a multiplexed function with out affecting the LCD. Figure 15, at the end of this document, shows the relation between target MCU signals and LCD glass pins through the JP1 option header. Installing a shunt at any position enables the LCD signal to the LCD. Removing a shunt at any position disconnects the LCD signal from the LCD.

## Contrast

LCD contrast control is controlled by the VLL3\_SEL option header. This option header applies either fixed or variable LCD contrast. Variable contrast control requires the target board be powered from an external +12V power supply connected to VIN.

**Figure 9: VLL3\_SEL Option Header**

**NOTE:** Silkscreen on VLL3\_SEL is incorrect. The RV1 selection actually connects to the CONTRAST POT and not the RV1 POT.

**NOTE:** Use of variable Contrast Control requires that +12V input be applied at VIN connector.

**NOTE:** VLL3\_SEL must be set to FIX if target board is powered from integrated USB-BDM.

**CAUTION**

Voltage input at VIN greater than +12V may damage the target board.

## USER I/O

User I/O includes 2 potentiometer, 8 push button switches, and 8 green LEDs, and 1 piezo buzzer for user I/O. The User1, User2, and Buz option header blocks enable or disable each User I/O function individually.

## Buzzer

The DEMO9S08LG32 target board provides an externally modulated piezo-buzzer for audible applications. A push-pull drive circuit allows the target MCU to easily drive the buzzer at a center frequency of 2300 Hz. Figure 10 below shows the USER enable position and associated signal for the buzzer.

**Figure 10: BUZ Option Header**

## Potentiometer

The DEMO9S08LG32 target board provides a 5K ohm potentiometer (POT) to simulate analog input. The POT is decoupled to minimize noise during adjustment. The POT is selectively assignable to ADC6 or ADC7 by the ADC option header.

The ADC option header also controls POT configuration. The POT may be configured as a variable pull-down resistance or may be connected to VDDA as a variable voltage input.

Figure 11 below shows the ADC option header selections.

**Figure 11: ADC Option Header**

| ADC  | Signal         | ON      | OFF      |
|--|----------------|---------|----------|
|  PTH0 | PTH0/KBI5/ADC6 | Enabled | Disabled |
|  PTH1 | PTH1/KBI6/ADC7 | Enabled | Disabled |
|  VDDA | VDDA           | Enabled | Disabled |

### CAUTION

While using pushbuttons KBI5 or KBI6 in end-user applications, the option jumper at PTH0 and, or, PTH1 should be removed. Pressing pushbutton KBI5 with option jumper installed at PTH0; or, pressing pushbutton KBI6 with option jumper installed at PTH1 will cause a target board POR.

## User LED's

The DEMO9S08LG32 target board provides 8, green, LEDs for output indication. Each LED is configured for active-low operation. A series, current-limit resistor prevents excessive diode current. Figure 12 below shows the USER1 enable position and associated signal for each LED.

**Figure 12: User1 Option Header**

|      | USER2   | Signal       | ON      | OFF      |
|------|---|--------------|---------|----------|
| T1C0 |  1 | PTH5/TPM1CH0 | Enabled | Disabled |
| T1C1 |  2 | PTH4/TPM1CH1 | Enabled | Disabled |
| T2C0 |  3 | PTI5/TMP2CH0 | Enabled | Disabled |
| T2C1 |  4 | PTI4/TPM2CH1 | Enabled | Disabled |
| T2C2 |  5 | PTI3/TPM2CH2 | Enabled | Disabled |
| T2C3 |  6 | PTF5/TMP2CH3 | Enabled | Disabled |
| T2C4 |  7 | PTF4/TPM2CH4 | Enabled | Disabled |
| T2C5 |  8 | PTF3/TPM2CH5 | Enabled | Disabled |

### CAUTION

While using pushbuttons KBI5 or KBI6 in end-user applications, the option jumper at PTH0 and, or, PTH1 should be removed. Pressing pushbutton KBI5 with option jumper installed at PTH0; or, pressing pushbutton KBI6 with option jumper installed at PTH1 will cause a target board POR.

## Pushbutton Switches

The DEMO9S08LG32 provides 8 push-button switches for user input. Each push-button switch is configured for active-low operation. No bias is applied to these push-button inputs. Use of target MCU internal pull-ups is required for proper operation. Figure 13 below shows the USER2 enable position and associated signal for each user switch.

**Figure 13: User2 Option Header**

| USER1 |   | Signal | ON        | OFF     |          |
|-------|---|--------|-----------|---------|----------|
| •     | • | KBI1   | PTH6/KBI1 | Enabled | Disabled |
| •     | • | KBI2   | PTH7/KBI2 | Enabled | Disabled |
| •     | • | KBI3   | PTH4/KBI3 | Enabled | Disabled |
| •     | • | KBI4   | PTF0/KBI4 | Enabled | Disabled |
| •     | • | KBI5   | PTH0/KBI5 | Enabled | Disabled |
| •     | • | KBI6   | PTH1/KBI6 | Enabled | Disabled |
| •     | • | KBI7   | PTH2/KBI7 | Enabled | Disabled |
| •     | • | KBI8   | PTH3/KBI8 | Enabled | Disabled |

# MCU I/O PORT

The MCU I/O PORT connector provides access to the MC9S08LG32 I/O signals. Figure 14 below show the pin-out for the MCU I/O connector.

**Figure 14: MCU I/O PORT – J1**

|                             |           |           |                              |

## LCD ENABLE OPTION HEADER

The LCD Enable Option Header allows the user to disable any LCD signal to the LCD. This allows any signal to be used for a multiplexed function without affecting the LCD. Figure 15 below shows the relation between target MCU signals and LCD glass pins through the JP1 option header. Installing a shunt at any position enables the LCD signal to the LCD. Removing a shunt at any position disconnects the LCD signal from the LCD.

**Figure 15: LCD Enable Option Header – JP1**

| MCU Pin # | MCU Signal  | LCD Signal | JP1 Pos # | JP1 Pin |    | LCD Pin |
